Scope of work:  To program by means of E prime Software a series of seven experiments that involve learning to associate an unfamiliar series of characters with a familiar series of sounds.  Each program will involve initial exposure to the stimuli and their associations;   training with feedback up to a particular criterion of accuracy; and then testing of the speed and accuracy and rate of learning these associations. These will be used to examine visual-auditory learning of  novel words in dyslexic vs. typical readers.  The experiments will initially be just behavioral. Later these tasks will be performed while the participant's spatiotemporal brain activity is being recorded by means of magnetoencephalograpy .  Thus  the goal is to  identify spatiotemporal patterns of neural activity that differ between the two groups and would illuminate the deficit that dyslexic readers have this automatization of the decoding of words.  This will provide preliminary data for a proposal.
